

MobiVisor per-App-VPN

Introduction

VPN stands for Virtual Private Network and offers the possibility of accessing the network from outside the company. The MobiVisor VPN encrypts your employees' Internet traffic in real time. When a mobile device leaves the secure company WiFi, it establishes an encrypted connection to the company servers (so-called tunnel) and is protected in insecure/open WiFi networks.

Features

VPN stands for Virtual Private Network and offers the possibility of accessing the network from outside the company. The MobiVisor VPN encrypts your employees' Internet traffic in real time. When a mobile device leaves the secure company WiFi, it establishes an encrypted connection to the company servers (so-called tunnel) and is protected in insecure/open WiFi networks.

VPN vs. per-App-VPN

VPNs are usually offered as whole-device VPNs, which means that you cannot define which apps or domains should run via VPN. As a result, all of a device's traffic runs via VPN. If you use several devices, the traffic adds up, which can lead to undesirable server overloads and performance problems. Conserve your resources and therefore use our per-app VPN.

MobiVisor per-App-VPN

Per-App-VPN

Per-app-VPN enables individual selection of apps that are to be activated for VPN. There are two types: In-house VPN and custom SSL. In-house VPN means that you use our VPN; custom SSL, on the other hand, allows you to use a VPN of your choice. In both cases, we provide the configurations for you!

Rapid setup

MobiVisor per-app-VPN is configured via the MDM portal and can be distributed remotely to all mobile devices. This saves you annoying travel and transportation. Do you need help with the setup? If required, you can get free support from our employees.

As soon as the configuration has arrived on the devices, no further steps need to be taken. The device is immediately protected (*iOS only requires the configuration settings. For Android, the VPN application developed by us must also be installed on the device*).

Homeoffice for all!

Thanks to MobiVisor's simple pre-configuration via app VPN, there is no longer any need for complicated steps on the device. This makes our solution suitable for all users, regardless of their previous technical knowledge. We make working from home possible for everyone. What are you waiting for? Enable your employees to work from anywhere!

MobiVisor per-App-VPN

Technical details

After users log in to their devices, the MDM server sends requests for VPN certificate creation to the web and VPN servers. These servers confirm the certificates and send them back to the MDM servers. The configurations are created in the admin interface and sent to the devices. Requests are then sent to the internal servers via the VPN tunnel. These requests differ depending on what the users use the VPN for.
